### 교과개요

This course is a rigorous introduction to programming using Python, emphasizing programming as a discipline of precise reasoning, abstraction, and problem solving rather than mere code writing. Students will design, implement, test, and analyze nontrivial programs while developing the ability to reason about correctness, performance, and failure modes.

### 교과목표

By the end of this course, students will be able to:

- Translate informal problem statements into precise specifications and implement correct, robust programs that satisfy them
- Decompose complex problems using functions, data abstractions, and well-defined invariants
- Reason about program execution, correctness, and asymptotic performance
- Design and evaluate systematic testing and debugging strategies
- Read, understand, and modify nontrivial code written by others
- Understand the capabilities and limitations of large language models as programming tools

### 수업방법

Lectures & experiment sessions

### 학습윤리

Programming assignments in this course are intended to assess your individual reasoning, design, and problem-solving skills. You may use external resources, including LLMs, but you may not submit code that you did not substantially design and understand yourself. Any use of AI tools must be explicitly documented, and you are responsible for the correctness and structure of all submitted work.

### 교과정책(방침)

All electronic devices are allowed in class. Attendance check will be done through in-class quizzes.

### 준비물 및 기타

Laptop with Visual Studio Code (VSCode) or PyCharm installed
