

지능형제어시스템(공) (EE406-01)

학기	2026년 1학기
담당교수	김경대
이수구분	교선평수
학점	3.0
강의시간	화13:00-14:30(E7 - 235), 목13:00-14:30(E7 - 235)
강의실	E3 212 (교수실)
소속	기초학부

교과개요

PART I explores a mathematical framework for describing and understanding dynamic systems, establishing the basics for control systems to identify and observe these systems. Specifically, it investigates the state-space model of a dynamic system and provides essential insights into linear observers and basics of Linear Quadratic control. The lecture concludes by examining Kalman filter design as a method for control systems to optimally capture the dynamic behavior of a system and integrating it to Linear Quadratic control.

PART II covers basic theories that are fundamentals in reinforcement learning, including Markov Decision Process, Dynamic Programming, and also introduces several representative reinforcement learning algorithms such as Monte Carlo Methods and Temporal Difference Learning, as well as several approaches to solve problems with large, high-dimensional, and potentially infinite state spaces.
