

커뮤니케이션 특강 (HSS207a-01)

학기	2026년 1학기
담당교수	조성겸
이수구분	교선평수
학점	3.0
강의시간	목13:00-16:00(E7 - G01)
강의실	
소속	기초학부

교과개요

This course explores artificial intelligence (AI) through a communication and social science lens. You will examine how AI systems communicate, explain information, persuade users, and shape social meaning in everyday tools such as search engines, chatbots, recommendation systems, and generative AI platforms like ChatGPT. Rather than studying AI only in theory, you will interact with custom-designed GPTs created specifically for this course. Through these experiences, you will see how AI functions as a communicative actor that reflects institutional goals, values, and design choices—and how even small differences in AI communication can lead to meaningful social consequences.

AI is treated as a communicative actor that speaks on behalf of institutions, organizations, and embedded design choices.. Students will experience how small differences in AI communication can lead to significant social consequences.

교과목표

By the end of this course, students will:

Understand AI as a system that communicates and shapes meaning, not just a technical tool.

Recognize how AI communication affects trust, bias, authority, and responsibility in everyday life.

Experiment with custom GPTs to see how design choices change what AI says and how it says it.

Develop skills to critically reflect on AI's role in public communication and daily interactions

수업방법

Each class follows a simple but engaging cycle. We begin with a brief lecture that introduces a key feature of AI communication, followed by short readings and discussion to frame the issue. Students then explore the topic hands-on by interacting with custom-designed GPTs, observing how AI responds when given different prompts. Finally, students modify the GPTs themselves and test the results, seeing firsthand how small changes in design can lead to noticeable differences in AI behavior. Through this process, the class turns abstract ideas about AI into concrete, observable experiences.

준비물 및 기타

Students do not need technical skills. In class, students will test and modify custom GPTs by changing prompts and instructions. Be ready to try things, compare outcomes, and notice small differences.
