

일반물리Ⅱ (BS105a-04)

학기	2026년 2학기
담당교수	유천열
이수구분	공통필수
학점	3.0
강의시간	월15:30-17:00(E2 - 115), 수15:30-17:00(E2 - 115)
강의실	E2 513 (유천열 교수)
소속	기초학부

교과개요

While classical mechanics deals with the motion of mass-bearing particles, electromagnetism broadly covers the motion of charged particles and systems of particles. You will learn about electric fields created by stationary charges, magnetic fields created by charges moving at a constant velocity, and electromagnetic waves created by accelerating charges. The course addresses the motion of charges and magnetic moments within these fields, as well as the properties of elements that make up electric circuits. To understand light, the ray model, wave model, and photon model of light will be examined, alongside topics such as reflection, refraction, interference, diffraction, polarization, and the photoelectric effect.

교과목표

Understand the basic concepts of charges, electric fields generated by charges, and magnetic fields and electromagnetic waves generated by moving charges. Comprehend the characteristics of light as a type of electromagnetic wave, including reflection, refraction, interference, diffraction, and polarization. Additionally, study basic circuits by understanding the movement of charges.

수업방법

Lecture (English)
