

아날로그 전자회로(공) (EE306-01)

학기	2026년 2학기
담당교수	이경태
이수구분	교선평수
학점	3.0
강의시간	화14:30-16:00(E7 - G02), 목14:30-16:00(E7 - G02)
강의실	
소속	기초학부

교과개요

This course covers advanced knowledge related to analog integrated circuit, including MOSFET-based single and multiple stage single-ended and differential amplifiers, operational amplifiers, feedback analysis, frequency domain analysis and stability, and electronic noise. The first part of the course reviews transistors, single-stage amplifiers, linearization, and transconductance. Basic differential amplifier structures are introduced next with DC and AC analysis, as well as important amplifier specifications such as CMRR, input/output ranges, and slew-rate. Then, introductory level of negative feedback and stability concepts including phase and gain margins will be provided. Lastly, we will study sources of noise and how it affect the overall signal-to-noise ratio.

교과목표

This course provides an entry point for the aspiring analog and mixed-signal IC designers. Students taking this course will be expected to experience advanced techniques and knowledges essential for analog IC design. They will acquire skills in analysis and IC design, which will be the foundation to take-on more advanced graduate and industry level courses.
